

CODECHECK certificate 2026-NNN

<https://doi.org/10.5281/zenodo.TODO>

Table 1: CODECHECK summary

Item	Value
Title	<i>FIXME add title</i>
Author(s)	FIXME add name 
Reference	https://doi.org/10.1234/example
Repository	https://github.com/example/repo
Codechecker(s)	FIXME add name 
Date of check	2026-01-01
Summary	TODO add summary

Table 2: Summary of output files generated

File	Comment	Size (b)
<code>example_output.txt</code>	TODO describe the file, e.g. 'Figure 1 in the paper'	missing

This check is based on the commit `d357eee68bffae95f53b1499c58e860095e6a3af` .

Summary

TODO add summary

CODECHECKER notes

TODO: How was the workflow reproduced? Which problems occurred and how were they solved (e.g. missing dependencies, changes to the code)? How long did the computations take? Are the reproduced outputs the same as in the paper, or how do they differ?

Recommendations to the authors

TODO: Suggestions to improve the reproducibility of the workflow, e.g. installation instructions, documentation of the expected run time, a continuous integration test.

Manifest files

Summary of all reproduced output files (tables, text files, figures, ...).

`example_output.txt`

Author comment: *TODO describe the file, e.g. 'Figure 1 in the paper'*

File missing: `outputs/example_output.txt` does not exist.

Acknowledgements

TODO: e.g. thank the authors for their support in reproducing their work.

Citing this document

FIXME add name (2026). CODECHECK Certificate 2026-NNN. Zenodo. <https://doi.org/10.5281/zenodo.TODO>

About CODECHECK

This certificate confirms that the codechecker could independently reproduce the results of a computational analysis given the data and code from a third party. A CODECHECK does not check whether the original computation analysis is correct. However, as all materials required for the reproduction are freely available by following the links in this document, the reader can then study for themselves the code and data.

About this document

This document was created using [codechecker-py](#) (a Python-based template for creating [CODECHECK](#) certificates). The CODECHECK details are filled into a [jupyter notebook](#) which is then converted into Markdown via [nbconvert](#). Afterwards it gets converted into [Typst](#) using [cmarker](#) and then into PDF using [Typst](#). `sh notebook_to_pdf.sh` will regenerate the report file.
